Alignment

The FT-1000 is carefully designed to allow the knowledgeable operator to make nearly all adjustments required for various station conditions, modes and operator preferences simply from the controls on the panels, without opening the case of the transceiver. These adjustments, plus certain internal settings, are described in the FT-1000 Operating Manual.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently be replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Yaesu service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized Yaesu service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Yaesu must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps.

ning, and follow all of the steps in a section in the order they are presented. \square DC Voltmeter (high-Z, >1-M Ω /V) ☐ RF Millivoltmeter ☐ AF Millivoltmeter ☐ RF Standard Signal Generator w/calibrated output and dB scale, 0dB=0.5μV ☐ AF Signal Generator with calibrated output ☐ Spectrum Analyzer (30 MHz) \Box 50- Ω Dummy Load \square 50- Ω Resistor ($\frac{1}{4}$ - or $\frac{1}{2}$ -W, film or composition) \square 600- Ω Resistor ($\frac{1}{4}$ - or $\frac{1}{2}$ -watt) \square 16.6- Ω Dummy Load (or 3 50- Ω loads that can be connected in parallel) ☐ Adjustable, Regulated DC Supply (0 ~ 5 V) Linear Detector ☐ RF Attenuator (200-W, 40-dB) or RF coupler

Rather, have all test equipment ready before begin-

Alignment Preparation & Precautions

A 50- Ω dummy load and inline wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

Except where specified otherwise, the transceiver should be tuned to 14.2 MHz, USB mode, and the following controls set as indicated:

MOX & VOX buttons OFF (■)
AGC to FAST
ATT to OFF
RX MIX & MONI to 12-o'clock
MIC & RF PWR fully CCW (minimum)
PROC & DRIVE fully CCW (minimum)
SQL fully CCW, NB 12-o'clock
AF as required, RF fully CW (maximum)
NOTCH & APF to 12-o'clock
SHIFT to 12 o'clock, WIDTH fully CW

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20 and 30 °C ($68 \sim 86$ °F). When the transceiver is brought into the shop from hot or cold air it should be allowed some time for thermal equalization with the environment before alignment.

Alignments must only be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in the alignment procedure are based on $0 dB\mu = 0.5 dB\mu V$.

Table note: DC voltages should measure within $\pm 10\%$ of those listed in the voltage tables.

VR3016 Location on AF Unit

☐ Briefly key the transmitter and adjust the RF PWR control clockwise so that the ammeter shows 23 amperes, then return to receive.

- ☐ Place your tuning tool in VR7601, key the transmitter again, and adjust VR7601 so that the supply just shuts down (the current drops from 23 amperes to zero).
- ☐ Return VR3016 to its original position, and remove the test equipment and replace the plug in J7605, if necessary.

PA Unit (RF Power Amplifier)

Select the SSB mode, and disconnect the microphone or turn the **MIC** gain fully CCW.

On the front panel, set the **METER** selector to **SWR**, and the **DRIVE** and **RF PWR** controls fully CW. Preset S7501 to OFF, VR7501 fully CCW, VR7502 fully CW, and TC7401 (on the Tuner Main Unit) to center.

Tuning Capacitor/Motor

(Mechanical Check, Setting & Adjustment)

☐ Loosen all setscrews in the shaft coupler, and turn the coupler by hand to confirm it moves freely (the motor and capacitor should not move). If the coupler binds, check the motor mounting position (it is soldered in place) and the capacitor mounting (screws).

- ☐ Turn the power switch off, and jump TP7501 to chassis ground.
- ☐ Turn the power switch on the motor should rotate, and then stop.
- ☐ Set the capacitor to its maximum capacitance position (plates fully meshed) by hand, and tighten all shaft coupler setscrews, using care not to disturb the capacitor or motor positions. Turn the power off, and jumper TP7502 to chassis ground (along with TP7501). Turn the power back on. The motor should move 180°, and the capacitor should be then at its minimum capacitance position (fully unmeshed). Remove the grounding jumpers from TP7501 and TP7502.

Tuner Control Unit Test & Alignment Points

SWR Meter Calibration

IF Unit

Notch Filter Oscillator

- \square With the **NOTCH** button OFF and the **NOTCH** control centered, preset TC2001 to center. Connect the DC voltmeter to pin 2 of J2019 and confirm 3.8 ± 0.2 V on the voltmeter.
- ☐ Select the LSB mode, and connect the frequency counter to TP2003. Adjust T2027 for 12.2835 MHz on the counter (if this frequency cannot be obtained, adjust TC2001). Now select the USB mode, and adjust TC2002, if necessary, for 12.2805 MHz ± 30 Hz on the counter.
- ☐ Return to LSB mode, set the **NOTCH** control fully CCW, and connect the RF millivoltmeter to TP2003. Adjust T2026 for peak (at least 700 mV_{rms}) on the meter.

4th Local Amplifier Level

In the LSB mode, set the **NOTCH** control to the 12-o'clock position, and connect the RF millivoltmeter to TP2004. Adjust T2025 for peak (at least 380 mV_{rms}) on the meter.

IF Unit: Receiver Test & Alignment Points

4th LO Premix 12.635-MHz BPF Level Check

Connect the RF millivoltmeter to J2017 (without removing the plug) and confirm at least 85 mV_{rms} .

4th LO Premix 12.28-MHz VCXO Level Check

Connect the RF millivoltmeter to J2018 (without removing the plug) and confirm at least 500 mV_{rms}.

2nd Local Amplifier Level

Connect the RF millivoltmeter to TP2002 and adjust T2022 for peak (at least 400 mV $_{rms}$).

AF Unit

BFO PLL

Connect the DC voltmeter to TP3003 and adjust TC3001 for 5.0 ± 0.2 V on the meter.

Receiver BFO

Select the LSB mode, and set the **NOTCH** control fully CCW. Connect the RF millivoltmeter to the wiper arm (center contact) of VR3001 and adjust T3001 for maximum (at least 480 mV_{rms}).

SSB Carrier Balance

Connect the RF millivoltmeter to the drain of Q2024 and adjust VR3001 for minimum voltage.

1st Mixer Balance

With LSB mode selected, tune the transceiver to the heterodyne at 655 kHz, and adjust VR1002 and VR1003 on the RF Unit for minimum heterodyne level (see below).

Mixer Balance Trimmer Locations on RF Unit

AF Unit: Receiver Test & Alignment Points

Main Rx RF & IF Interstage Transformers

With the RF signal generator connected to the main ANT jack, inject 80 dB μ at 14.2 MHz. Tune the transceiver to the signal, USB mode, and adjust T1010 ~ T1014 on the RF Unit for maximum S-meter deflection. Then adjust T2001 ~ T2004, T2007 ~ T2010, T2013 and T2030 for maximum deflection. Reduce the injection level, if necessary, to keep the S-meter near mid-scale.

RF AGC

With the RF signal generator and transceiver set up as in the previous procedure, connect the DC voltmeter to L1085 and adjust VR1001 for 0.7 \pm 0.1 V.

S-Meter Calibration & IF Gain

- ☐ With the same signal generator and transceiver setup as above, reduce the injection level to nil and adjust VR2006 just to the point where the S-meter begins to deflect with the RF gain control fully clockwise.
- ☐ Turn the RF gain fully counterclockwise, and adjust VR2005 for S9 +60 (full scale) on the S-meter.
- □ Return the RF gain fully clockwise, set the injection level to 8 dBμ and adjust VR2004 for S-1 deflection on the S-meter. Increase the injection to 100 dBμ and adjust VR2005 (again) for S9 +60 (full scale) on the S-meter.
